PHASE I BOOK EXPLOITATION

SOV/4396

Akademiya nauk SSSR. Energeticheskiy institut

Konvektivnyy i luchistyy teploobmen (Convection and Radiation Heat Exchange)
Moscow, Izd-vo AN SSSR, 1960. 254 p. Errata slip inserted. 3,200 copies
printed.

Ed.: M.A. Mikheyev, Academician; Ed. of Publishing House: G.B. Gorshkov; Tech.
Ed.: V.V. Bruzgul'.

PURPOSE: The book is intended for scientists and engineers working in various
branches of science and industry concerned with thermodynamics and heat trans-
fer problems.

COVERAGE: The book consists of 19 original articles on various problems in thermo-
dynamics. The following subjects are discussed: mechanism of heat transfer
processes, intensification of heat exchange, determination of thermophysical
properties of operating media, heat transfer in supersonic flow of gas, and
combustion chambers and nuclear reactors. Theory and experimental techniques
are described. Each article describes the conditions of the experiment and
tables of the experimental data obtained are given. The data may be used for
calculations of heat transfer and heat exchangers, always taking account of

Card 1/ 5

SOV/4396

Convection and Radiation Heat Exchange

the special experimental conditions under which the data were established.
No personalities are mentioned. References follow most of the articles.

TITLE:

New Conversions of Pyridine Salts and the Synthesis of
 γ -Substituted Pyridines (Novyye prevrashcheniya piridiniyevykh
soley i sintez γ -aminozameshchennykh piridinov).

PERIODICAL: Doklady AN SSSR, 1957, Vol. 114, Nr 6, pp. 1235-1238 (USSR)

ABSTRACT:

The authors earlier made the attempt of cleaving the pyridine ring in α -alkoxy-, phenoxy- and methylmercapto-substituted pyridines by the influence of aromatic amines upon chloro- (2,4-dinitrophenylate) of the pyridine bases (I). It became evident that the ring cannot be cleaved, but that a replacement of the alkoxy- (or of the methyl-mercapto- or phenoxy-) group by the residue of the aromatic amine under formation of chloro- (2,4-dinitrophenolates) of γ -arylamino-pyridines (II) takes place (reference 1). In their further work the authors succeeded in cleaving the pyridine ring by acting upon γ -alkoxy (methylmercapto-, phenoxy-) pyridines with bromocyanogen and aromatic amines (reference 2). Thus they obtained dialkyl-salts of the β -alkoxy (merhylmercapto-, phenoxy-) substituted glutacon - aldehydes (III). These and

Card 1/4

New Conversions of Pyridine Salts and the Synthesis of
 γ -Substituted Pyridines

20-114-6-27/54

further conversions may be considered a special case of the general replacement reactions of the γ -alkoxy (phenoxy)-groups by the residues of aromatic amines in pyridine salts which contain electronegative radicals ($C_6H_5(NO_2)_2 \rightarrow C_6H_5^-$) at the cyclic nitrogen (reference 1). By conjugation of the π -electrons of the oxygen atom in the group $-\text{OAlk}(-\text{OC}_6H_5)$ with the residual part of the pyridine-salt molecule these compounds are given the property of oxonium salts (reference 5). The authors became interested in the problem of the mobility of the alkoxy group in the γ -alkoxypyridine-haloalkylates. It was found that in interactions of γ -methoxypyridine-iodomethylate with aniline (in an alcohol solution in the water bath) methyl iodide is split off and N-methyl- γ -pyridone is produced. Thus the transition of the cyclic nitrogen atom into the tetravalent state alone is not enough to impart the capability of substitution to the alkoxy group. Besides, an electronegative radical must exist at this atom. Furthermore the capability of substitution of the phenoxy groups toward residues of the aromatic amines in γ -phenoxyypyridine-iodomethylate were also investigated. This

Card 2/4

New Conversions of Pyridine Salts and the Synthesis of
 γ -Substituted Pyridines

20-114-6-27/54

exchange easily takes place on heating of a mixture of the haloid-hydrogen salt of γ -phenoxy pyridine or of the salt of the aromatic amine with γ -phenoxy pyridine. This exchange does, however, not take place on heating of a salt mixture of γ -phenoxy pyridine and of aromatic amine. From this follows that the γ -phenoxy pyridine cation and a free amine participate in the reaction. In the same manner the phenoxy group can be replaced by the amino group and by residues of the primary and secondary aliphatic amines. Thus γ -cyclohexyl-aminopyridine and γ -dimethylaminopyridine were synthesized. γ -aminopyridine easily develops on heating of γ -phenoxy pyridine with ammonium chloride. The latter reaction offers several advantages in comparison to those known (references 7,8). There are 11 references, 3 of which are Slavic.

AUTHOR: Miknelyan, A. L.; Turkov, Yu. G.

TITLE: Contribution to the theory of a laser operating in the accumulation mode

SOURCE: Radiotekhnika i elektronika, v. 9, no. 4, 1964, 743-747

TOPIC TAGS: variable Q laser, accumulation mode laser, resonator time constant, population level difference

ABSTRACT: Equations are derived for the resonator time constant, the number of quanta in the resonator at one operating mode, and the difference in level population for a laser in which the Q is made adjustable to accumulate active atoms of the medium at a metastable level during the pumping process. The calculations are made by regarding the laser as an idealized two-level system, and show that the leading front of the laser spike is inversely proportional to a parameter that characterizes the rate of change of the Q (see Fig. 1 of Enclosure). When the Q of the laser noticeably exceeds the threshold level at the instant of the spike, the spike duration depends little on the Q switching rate. If the threshold level is only slightly exceeded, the dependence becomes strong. If the Q

Card 1/3

ACCESSION NR: AP4038628

is turned on slowly, the laser output consists of a sequence of individual pulses. More rigorous calculation must take account of the multimode character of the laser and the variation of the line shape during the emission. Orig. art. has: 6 figures and 10 formulas.

AUTHORS: Gorgolewski, S. Hanasz, J., Iwaniszewski, H., Turlo, Z.

TITLE: Log-periodic-aerial-interferometer for radio astronomy

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 9, 1962, 53,
abstract 2A376 ("Bull. Acad. polon. sci. Sér. sci. math., astron.
et phys.", 1961, v. 9, no. 9, 689 - 691, English; Russian summary)

TEXT: Information is given on the construction of an interferometer (base
is 26 m) with logarithmic antennas having the following parameters: $\alpha = 60^\circ$, $\psi = 37^\circ$,
 $\tau = 0.6$. These parameters ensure the antenna amplification factor ~ 6 decibel re-
lative to the dipole in the band from 100 to 1,000 Mc, at the width of directivity
diagram of each antenna being 100° . Advantages of antennas with logarithmic struc-
ture are pointed out. \checkmark

AUTHOR: Turlo, Z.; Gorgolewski, S.; Hanasz, J.44
B+1ORG: Astronomical Observatory of the Copernicus University, TorunTITLE: Shape and orientation of the outer solar corona

VY

SOURCE: Ceskoslovenska akademie ved. Astronomicky ustav. Publikace, no. 51, 1965. 3rd Consultation on Solar Physics and Hydromagnetics, Tatranska Lomnica, 13-16 October 1964, 141-144TOPIC TAGS: solar activity, solar corona, galactic magnetic field, solar apex, gas interstellar gas, radio source, solar spectrum, interstellar ~~matter~~ particle, red corona line, green corona line

ABSTRACT: On the basis of previous works, the author considers factors liable to influence the extension and asymmetry of the outer corona in an effort to find out if these phenomena are real and enduring. They include solar activity, solar movement toward the apex, and the galactic magnetic field. It is found that solar activity

Card 1/3

L 44083-66

ACC NR: AT6020513

is not the main factor causing asymmetrical occultations. The direction of the solar apex is found to be rather similar to that of the maximum asymmetry of the solar corona. Convergence of these directions suggests that coronal asymmetry is caused by dynamic pressure of interstellar gas. Interaction between coronal and interstellar particles occurs in occultation regions. This effect is difficult to estimate quantitatively because of the numerous assumptions that have to be made. The direction of the galactic magnetic field is determined, and this determination agrees with the direction of the polarization conversion point. It is nearly perpendicular to that of the greatest extension of the outer corona. The influence of this field on the outer solar corona is assumed to be negligible. Conclusions on the shape of the outer corona are not completely clear, but occultations of many radio sources appear to constitute a very promising method of studying the shape. More occultation observations are needed to ascertain whether the dynamic pressure of interstellar gas and of sporadic solar activity are indeed the main factors influencing the shape of the outer corona. The noticeable annual asymmetry of intensities of the red and green coronal lines may be related to the asymmetry of the outer corona observed

Card 2/3

L-44083-66

ACC NR. AT8020513

during occultation of radio sources. In the discussion following the article, the author states that the values for the distance from the sun where interstellar particles are stopped in the corona are computed for the temperature $(T_0) = 10^6$ K. Orig. 115. Art. has: 2 figures, 6 formulas, and 2 tables. [GC]

61AUTHOR: Turlo, Z.ORG: Astronomical Observatory of N. Copernicus University, TorunTITLE: Positions and radiation intensity of solar active centers observed with an E-W94 λ interferometerSOURCE: Esckoslovenska akademie ved. Astronomicky ustav, Publikace, no. 51, 1965.
3rd Consultation on Solar Physics and Hydromagnetics, Tatranska Lomnica, 13-16
October 1964, 156-159TOPIC TAGS: sun, sunspot, solar disc, solar radiation, solar disturbance, quiet sun,
radiation intensity/E-W94 λ interferometerABSTRACT: The author reports on observations of solar active centers and radiation intensity made with a two-aerial E-W 94 λ interferometer working at a frequency of 127 MHz and described in detail. The observations were made during the period from 15 May to 19 September 1964, during which the sun was extremely quiet, although strong phase and amplitude variations were recorded from 14 to 19 August, the maximum occurring on 15 August. Measurements of the phase, amplitude, and mean period of interferometric records gave valuable information on the positions, "drifts," and the intensity of solar active centers. The author remarks that due to inherent

Card 1/2

L 41337-66

ACC NR: AT6020516

interferometric ambiguity, the method described in the article can be used during a period of minimum solar activity (minimum sunspots), when only a single center is present on the solar disk. In a discussion which follows the article, the author states that he has at present no optical data to confirm the probable relation between a sudden shift of the radio source on 18 August 1964 and the optical active region. Yu. I. Klymenko (Secretary); M.A. Savchenko and V.M. Popov (Institute); Prof.

M.I. A.N. Ovchinnikov.

NOTES: This collection of articles is intended for biologists, physicians,

and medical personnel.

CONTENTS: The collection contains 33 papers on problems of pathophysiology and therapy

biology and 33 reports on the theory and practice of immunology. To avoid

repetition of names of organizations in the table of contents the following

articles are grouped: "USSR Scientific Research Institute of Injuries and Diseases"

in "Russian Institute"; "Family medicine" in "USSR Medical Institute";

"Bacteriological Treatment and Vaccination Institute" (Department of Microbiology)

in "USSR Department of Microbiology"; "USSR Department of Microbiology",

"Infectious Diseases Institute", On the Preparation of a

Laserical Antigen for Infective Immunization Section

Title : Changes in the Respiratory Process in Plants Affected by
Gall Nematodes

Orig Pub : Dokl. AN SSSR, 1957, 115, No 6, 1227-1228

Abstract : In cucumbers and lettuce the respiration rate (determined by the Boysen-Jensen Method) in young galls (1-3 mm) was higher than in healthy rootlets. In the decomposing galls the intensity increased again. The bean rootlets infected with the gall nematode also breathed with greater intensity than the healthy ones. The author connects this with the increased protein synthesis during the period when a poor accumulation of the products of nematode life activity induces intoxication. In peas, radishes, pepper and eggplant a decrease in the respiration rate took place at the start of gall growth due to trauma resulting from the nematode in-

Title : Application of an Electric Current for the
Destruction of Nematodes in the Soil

Orig Pub : Priroda, 1957, No 8, 97-98

Abstract : Soil infected with Root-knot nematodes was placed in glass tubes, at the ends of which were placed electrodes from tin foil connected with high frequency alternate current. The period of soil processing lasted from fractions of a second to several seconds. After the soil was processed cucumber seeds were planted; the plants were grown for a period of 1 month; they were tested for infection by root-knot nematodes.

G

Abs Jour : Ref Zhur-Biol., No 13, 1958, 57874

Abstract : The plants were only slightly infected when an electrical gradient of 30 to 100 v/cm was applied; with an electrical gradient of 500 to 600 v/cm there was no infection. Since the soil was practically not heated, the death of the larvae was ascribed to the electotraumatic action of the high tension current.

Title : On the Effect of Some Chemical Preparations on
the Reproduction of Saprobioitic Nematodes
Orig Pub : Zool. zh., 1957, 36, No 8, 1145-1149
Abstract : A number of chemical substances which posses nematostatic action expressed in lower fertility of the nematodes and prolonged ontogenesis have been developed. The substances are divided into 2 groups: toxic which can be applied only to decorative plants(systox--0.5% concentration, pyrophos--0.5 to 1% concentration, and octomethyl--1 to 1.5% concentration); slightly toxic which can be applied to vegetable plants(ammonium nitrate--3%, potassium thiocyanate--0.25%, sodium salycilate--0.15%). Because of its great toxicity lithium carbonate is of no practical value.

TITLE:

A New Method of Fighting the Gall Nematode (Novyy metod bor'by s gallovoj nematodoj)

PERIODICAL:

Priroda, 1958, Nr 5, pp 95-96 (USSR)

ABSTRACT:

The gall nematode is causing much damage in the greenhouses and botanical gardens of the Moscow Oblast'. Certain successes were achieved by fighting the nematode with physical (killing the nematode eggs and larvae with hot steam in the soil), chemical (use of chloropicrin, forbiate, cystogone and drug Nr 23 in the soil) and biological (destruction of the nematode larvae by "preying" bacteriae according to Saprunov's method) means. This was possible to a certain degree with annual plants which were removed at the end of the growing season and later replaced by new plants. It was of little avail with respect to lasting plants. The new method of "therapeutic control" does not destroy the nematode, but low concentration of chemical substances, called nematostatic, merely retard the development of the nematode larvae. This method combined with a preparation of the soil to prevent a new invasion of the gall nematode leads to the total de-

Card 1/2

struction of the nematode. Chemicals used in successful Soviet experiments were: potassium thiocyanate, salicyl sodium and ammonium nitrate, 1% of the latter and 0.25% of each of the first two in a solution. The test plants, cucumbers, were watered with the solution 3 times at intervals of 4 to 5 days, (5 to 7 days upon heavy contamination with gall nematodes). The success was measured by the amount of male nematodes reaching the fertility stage. While the amount of fertilized eggs was 890 to 1,015 in the control vessel, there were 77 to 127 eggs after watering with potassium thiocyanate solution and 46 to 400 after use of the ammonium nitrate solution. The plants even endured after a 3-time application of a 1% solution. There are 2 photos.

ABSTRACT:

On the Modification of the Respiratory Process in Plants Under the Influence of Gallnut Nematodes (Ob izmeneii dykhatel'nogo protessa u rasteniy vliyaniyem galovogo nematodoza).
Doklady AN SSSR, 1957, Vol. 115, Nr 6, pp. 1227-1228
(USSR)

The gallnut nematodes (*Meloidogyne incognita*) in affections of roots forms galls which have a size of from 20 mm to the size of a child's fist. These formations disturb the normal physiological processes. This inhibits the respiration and may even lead to the death of the plant. The 1 mm large galls is peculiar: In cucumbers the respiration decreases, in decomposing galls the intensity of root. In 5, 10 and 20 mm large galls increases. About the same observations are made with lettuce and beans. Somewhat different is the picture in peas, radishes, pepper and eggplant (*Melanzana*). In peas the intensity increases up to 3 mm large galls and begins

to decrease in 5 and 10 mm large galls. In the other last-mentioned types of plants the intensity, as compared to the healthy roots, decreases. The increase in intensity in small galls may apparently be explained by the increased protein-synthesis from flowing-in carbohydrates. The decrease is probably due to the prevalence of the decomposition processes and the accumulation of the products of the vital action of nematodes. A later increase in intensity may perhaps be effected by other, saprobiotic nematodes and bacteria which intrude later on, after the gallnut nematode has already left the gall. In the last-mentioned plants the decrease in intensity may be explained by the original injury caused by the penetration of the gall nematode. When this influence dies down, the respiration again becomes normal. The plant thus undergoes a flowing-down of nutritive substance from the over-ground parts into the root-system; thereby it is weakened and the crop is reduced.

There are 4 references, 3 of which are Slavic.

A new method and apparatus for the study of gas exchange in soils. I. A. Turyun. *Pochvovedenie* (U.S.S.R.) No. 1, 72-80 (1952). — The new app. is illustrated and described in detail. The idea behind it is to get the gas from the soil as rapidly as possible into a chamber of the app. and bring it to the lab. for immediate analysis. The object of the procedure is to approximate the speed of analysis of the gas mixt. to the speed with which the mixt. changes its compn.

Title : On the Theory of Gas Exchange in Soils
Orig Pub : Pochvovideniye, 1957, No 7, 22-30

Abstract : The component parts of soils and the main atmospheric gases may be arranged in the order of their increase in sorption activity as follows: sand, clay, CaCO_3 , humus, MgCO_3 , N_2 , O_2 , CO_2 , and water vapors. The process of sorption of gasses in the soil is regulated by the soil temperature. In soils in which the average temperature during the summer does not exceed 15° , CO_2 in a sorbed state predominates. With a rise of the temperature from $15-18$ to $35-40^{\circ}$ a satu-

Abstract : ration of the pores of the soil and soil solution with carbon dioxide is noted. At average temperatures higher than 30° and optimal soil irrigation, CO₂ is not retained in the soil and escapes into the atmosphere in abundant quantities. In soil unsaturated with water vapors CO₂ may be sorped by the soil at temperatures higher than 40-60°. When the soil is irrigated a desorption of gasses and a change in the composition of the air in the soil takes place; irrigation of dry soil changed the concentration of CO₂ from 0.1 to 1.6% within 1.5 minutes. The effect of the irrigation of the soil on gas desorption is greater if the soil is dry before the watering. Repeated irrigations did not essentially change the composition of air in the soil.
